Comparison of 1.1 and Code New Event-Study Estimates

Current dynamic-sharing specification

1 Code Differences Between 1.1 and Code New

The current 1.1 do-file was run with its saved settings for six quarterly `price1` regressions. The comparison uses the same Code New `quarterly` series as the previous report. Both sides use the `drop_sentinel_yearquarter` roster variant, narrow sample, `req2`, the `Not` control group, upper-p95 winsorization followed by logs, and horizons 0–7. Both use dynamic ATC3 sharing and omit Kappa controls.

Table 1: Current regression specifications

Regression element	Current 1.1	Code New reference
Unit fixed effects	Company × product × cohort	Product × cohort
Time fixed effects	Cohort × calendar quarter	Cohort × calendar quarter
Other-event histories	Omitted	Omitted
ATC3 fixed effects	Omitted	Omitted
Pre-event test	`pretrends(3)`	`pretrends(4)`
Clustering	Company name	Numeric groups of company name

2 Coefficient Comparison

The table compares the original and modified 1.1 series archived in the previous report with the fresh 1.1 run. The archived modified series used fixed event-quarter sharing. Each row is compared with the same Code New quarterly estimates over the common horizons.

Table 2: Mean absolute coefficient gaps from Code New in log points

1.1 series	Pre, −3 to −1	Post, sharing 0	Post, sharing 1	All matched
Original 1.1 (archived)	0.004953	0.006818	0.029479	0.016065
Modified 1.1 (archived)	6.20e-09	0.001938	0.027392	0.012350
Current 1.1 (new run)	6.20e-09	3.94e-08	6.92e-08	4.67e-08

Notes. Pre-event coefficients are pooled across sharing groups and counted once per horizon. Post-event columns include the event quarter, with horizons 0–7. The common comparison contains 18 pre-event and 96 post-event coefficients. The fourth Code New lead is outside the common window.

3 Remaining Differences

Table 3: Current 1.1 versus Code New by event and treatment side

Event	Side	Cohorts	1.1 observations	Code New observations	Largest gap
`interlock_dissolution`	A side	31	109,824	109,824	6.85e-08
`interlock_dissolution`	B side	30	94,944	94,944	7.21e-08
`to_B_still_in_A`	A side	32	108,396	108,396	1.31e-07
`to_B_still_in_A`	B side	32	130,236	130,236	8.60e-08
`to_B_not_in_A`	A side	20	73,992	73,992	2.59e-07
`to_B_not_in_A`	B side	15	66,192	66,192	1.49e-07

Notes. Observations are counts from the estimation outputs. The largest gap is the maximum absolute difference in point estimates across common horizons, in log points.

The largest post-event gap is 2.59e-07 log points for `to_B_not_in_A`, A side, at quarter 5 in sharing group 1. The 1.1 and Code New estimates are -0.11875823 and -0.11875797.

The largest common pre-event gap is 1.41e-08 log points for `to_B_still_in_A`, B side, at quarter -3 in the pooled pre-event test. The 1.1 and Code New estimates are 0.04193950 and 0.04193952.

The six regressions use 583,584 observations in total. Treated and control row counts agree in 6 of the six event-side comparisons. The cohort input audit found the same rows and values for all common fields in the 160 selected cohort files, including the quarterly sharing labels.

Across the 160 selected cohorts, each of the 48,632 product-by-cohort groups belongs to exactly one company. Adding company to the fixed-effect key therefore leaves the grouping of rows identical on these samples. The fourth lead is recorded as zero with zero standard error in all six Code New exports. In the corresponding four-lead replication from the previous report, Stata marked that term as omitted. The lead test is estimated separately from the post-event treatment effects.

Sources. Current estimates are from the six Stata coefficient exports for the saved 1.1 do-file. Code New estimates are from the quarterly `price1` extract used in the previous comparison. The archived 1.1 series are from `coefficient_comparison.csv` in the previous report folder.

4 Event-Study Figures

`interlock_dissolution`, A side

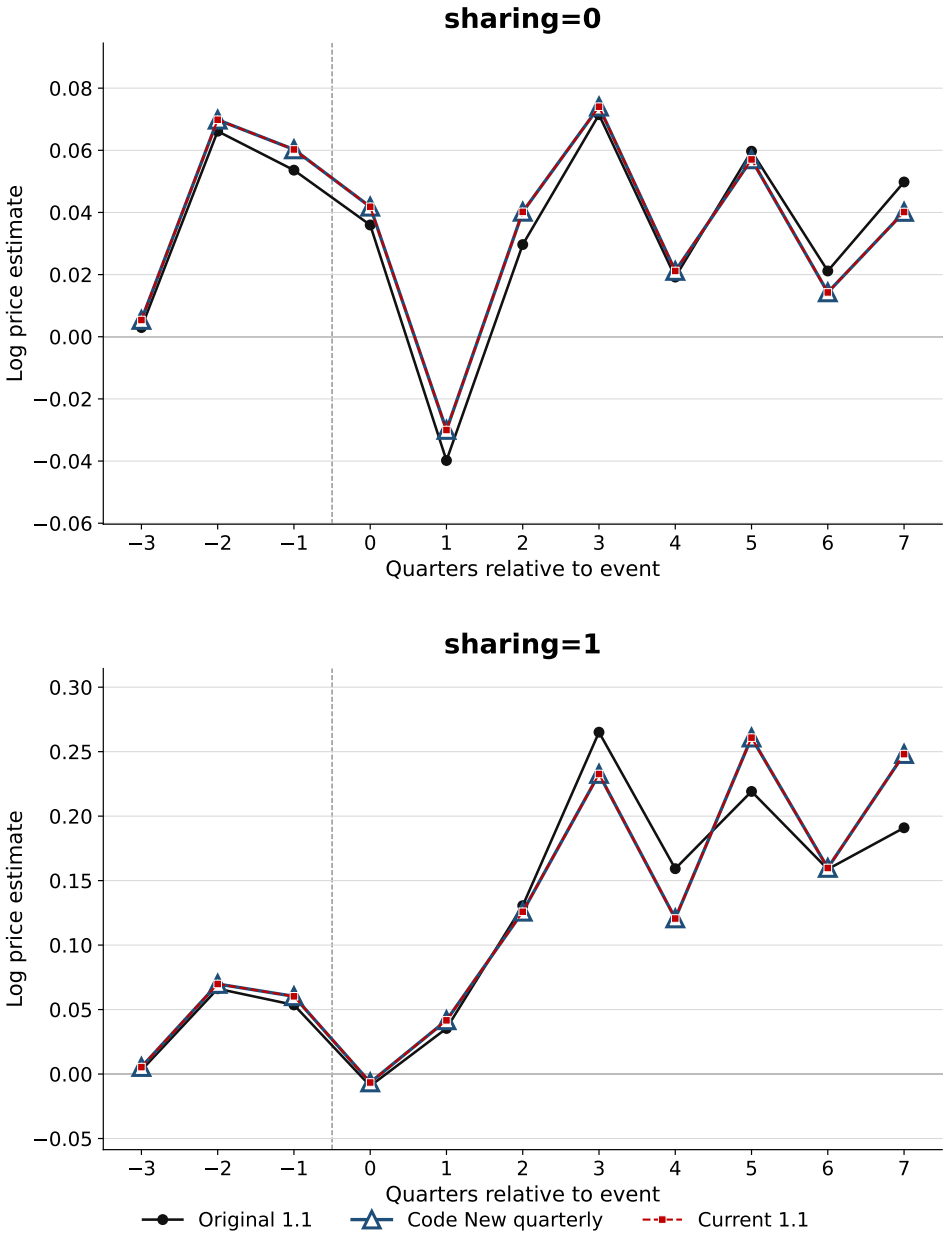

Figure 1: Event-study estimates for `interlock_dissolution`, A side.

Notes. Black circles show the original 1.1 results from the earlier report, hollow blue triangles show Code New quarterly, and red squares show the current 1.1 run. The mean absolute gap from Code New over horizons 0–7 is 1.19e-08 for sharing 0 and 3.50e-08 for sharing 1.

`interlock_dissolution`, B side

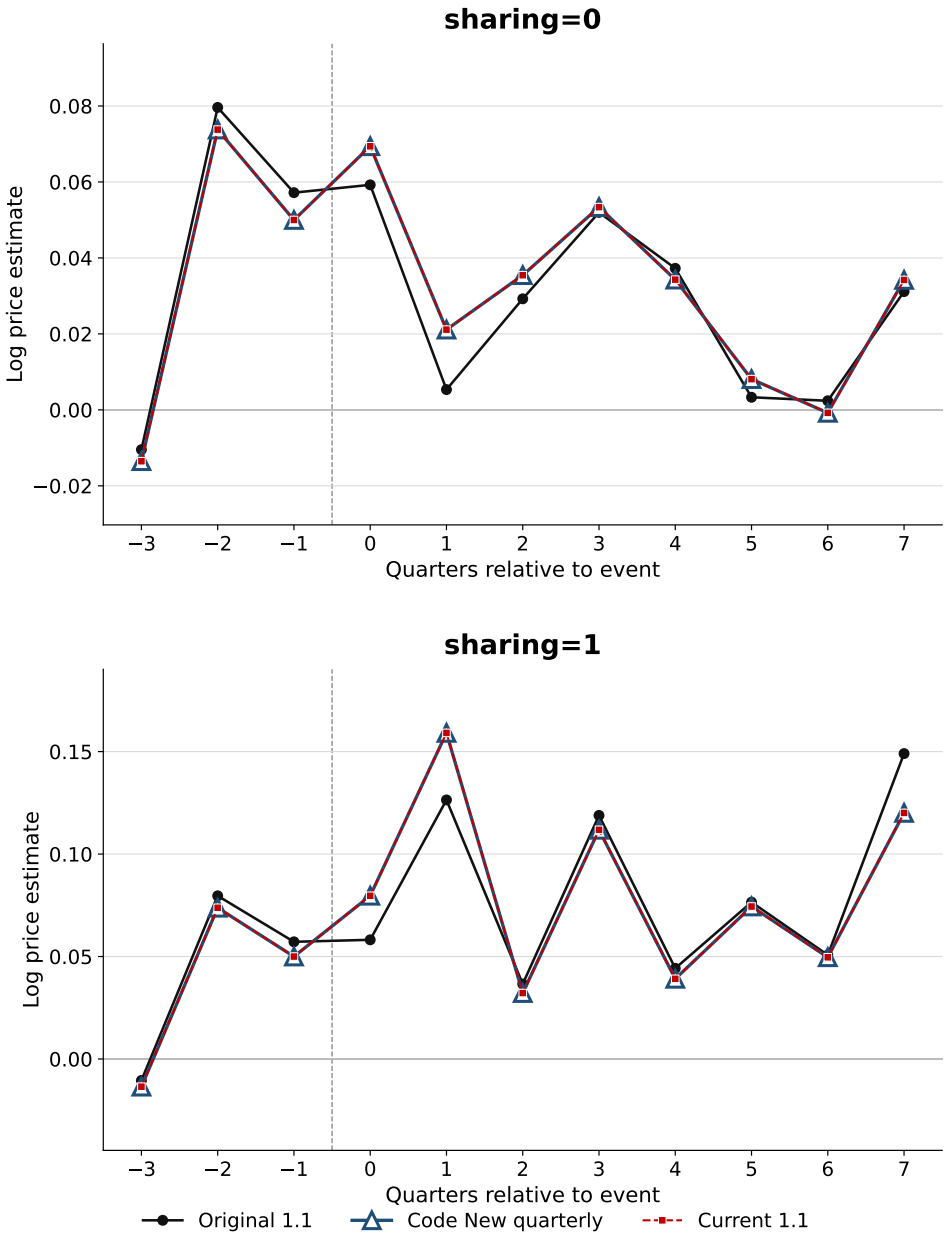

Figure 2: Event-study estimates for `interlock_dissolution`, B side.

Notes. Black circles show the original 1.1 results from the earlier report, hollow blue triangles show Code New quarterly, and red squares show the current 1.1 run. The mean absolute gap from Code New over horizons 0–7 is 2.19e-08 for sharing 0 and 4.01e-08 for sharing 1.

`to_B_still_in_A`, A side

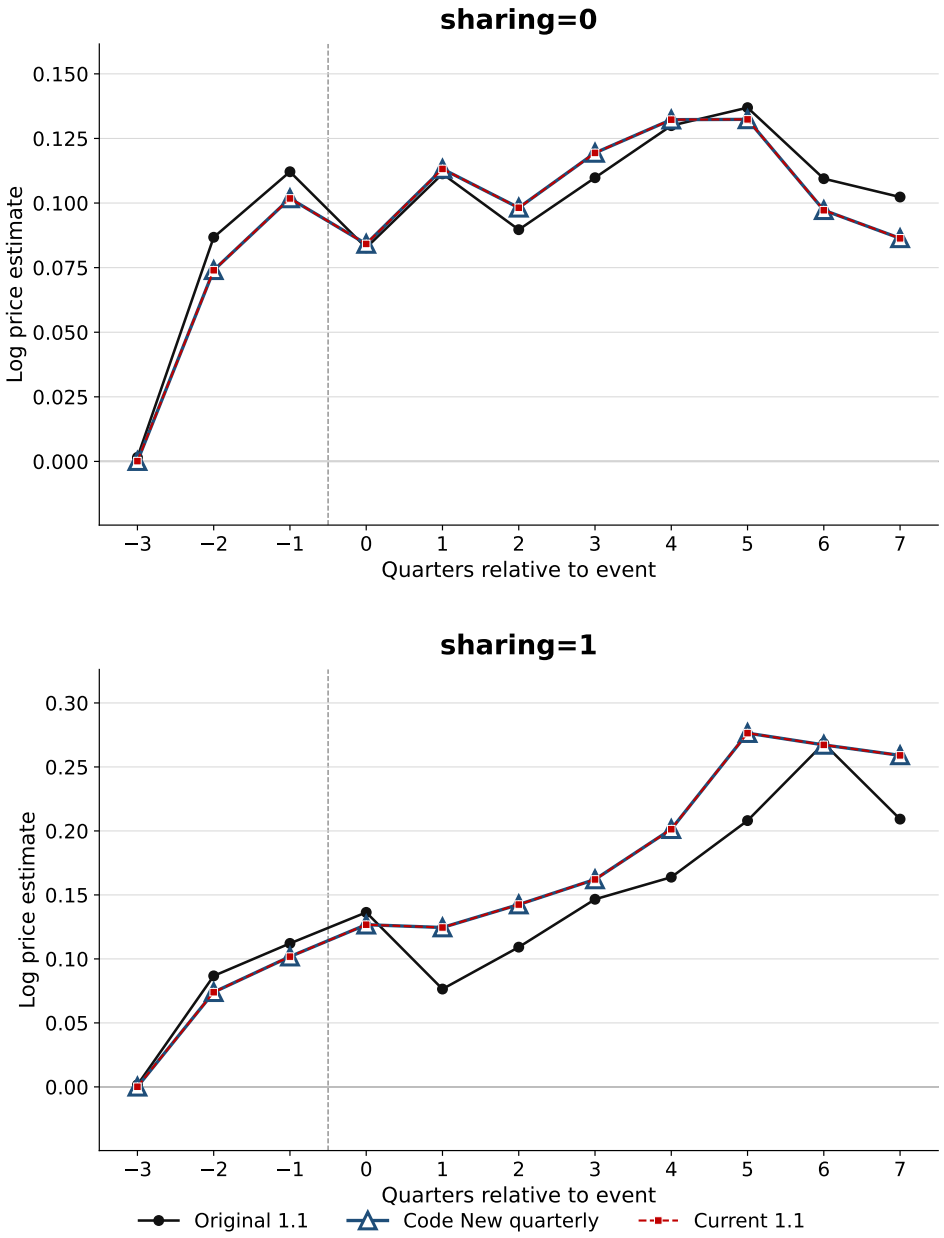

Figure 3: Event-study estimates for `to_B_still_in_A`, A side.

Notes. Black circles show the original 1.1 results from the earlier report, hollow blue triangles show Code New quarterly, and red squares show the current 1.1 run. The mean absolute gap from Code New over horizons 0–7 is 1.09e-07 for sharing 0 and 7.94e-08 for sharing 1.

`to_B_still_in_A`, B side

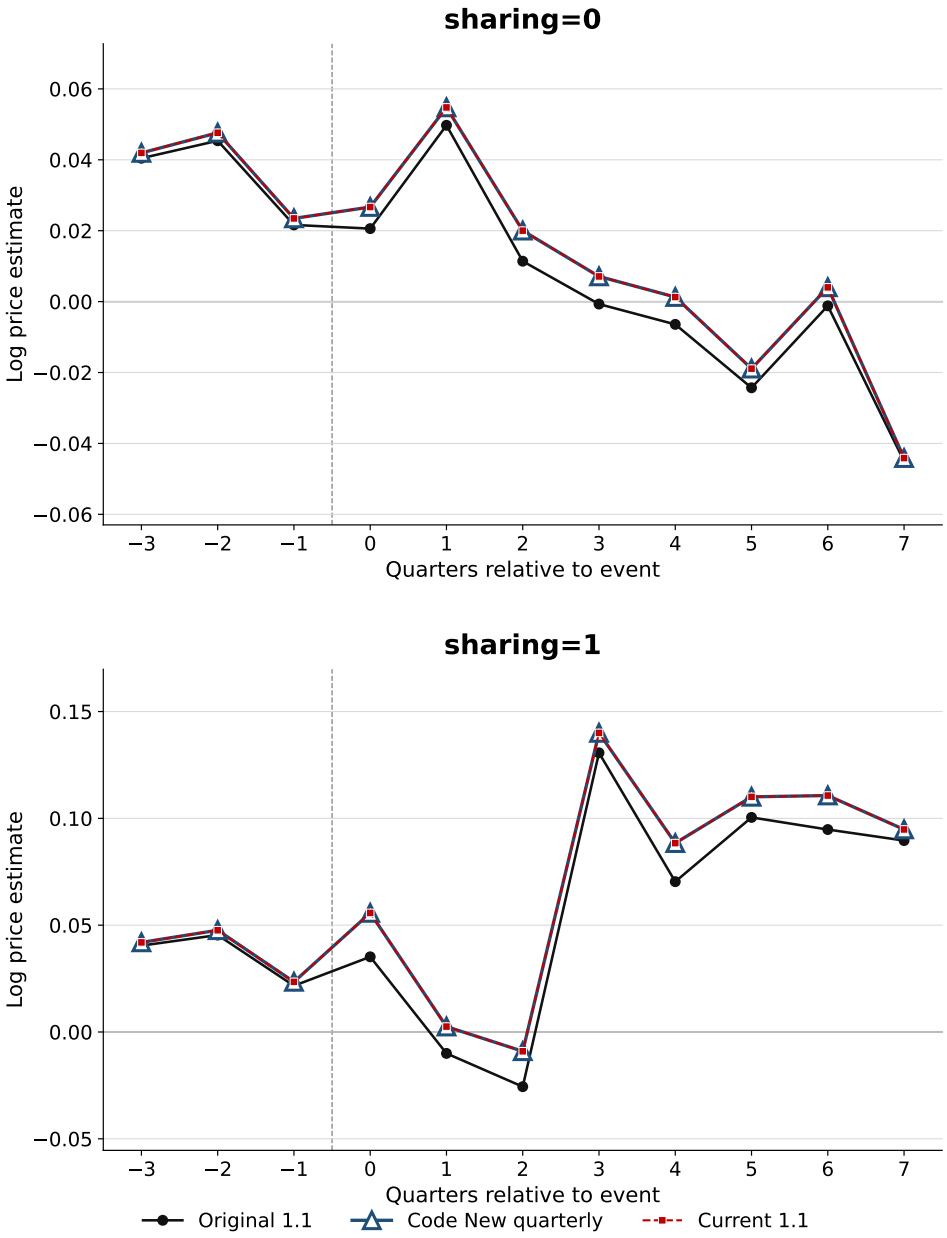

Figure 4: Event-study estimates for `to_B_still_in_A`, B side.

Notes. Black circles show the original 1.1 results from the earlier report, hollow blue triangles show Code New quarterly, and red squares show the current 1.1 run. The mean absolute gap from Code New over horizons 0–7 is 1.70e-08 for sharing 0 and 4.26e-08 for sharing 1.

`to_B_not_in_A`, A side

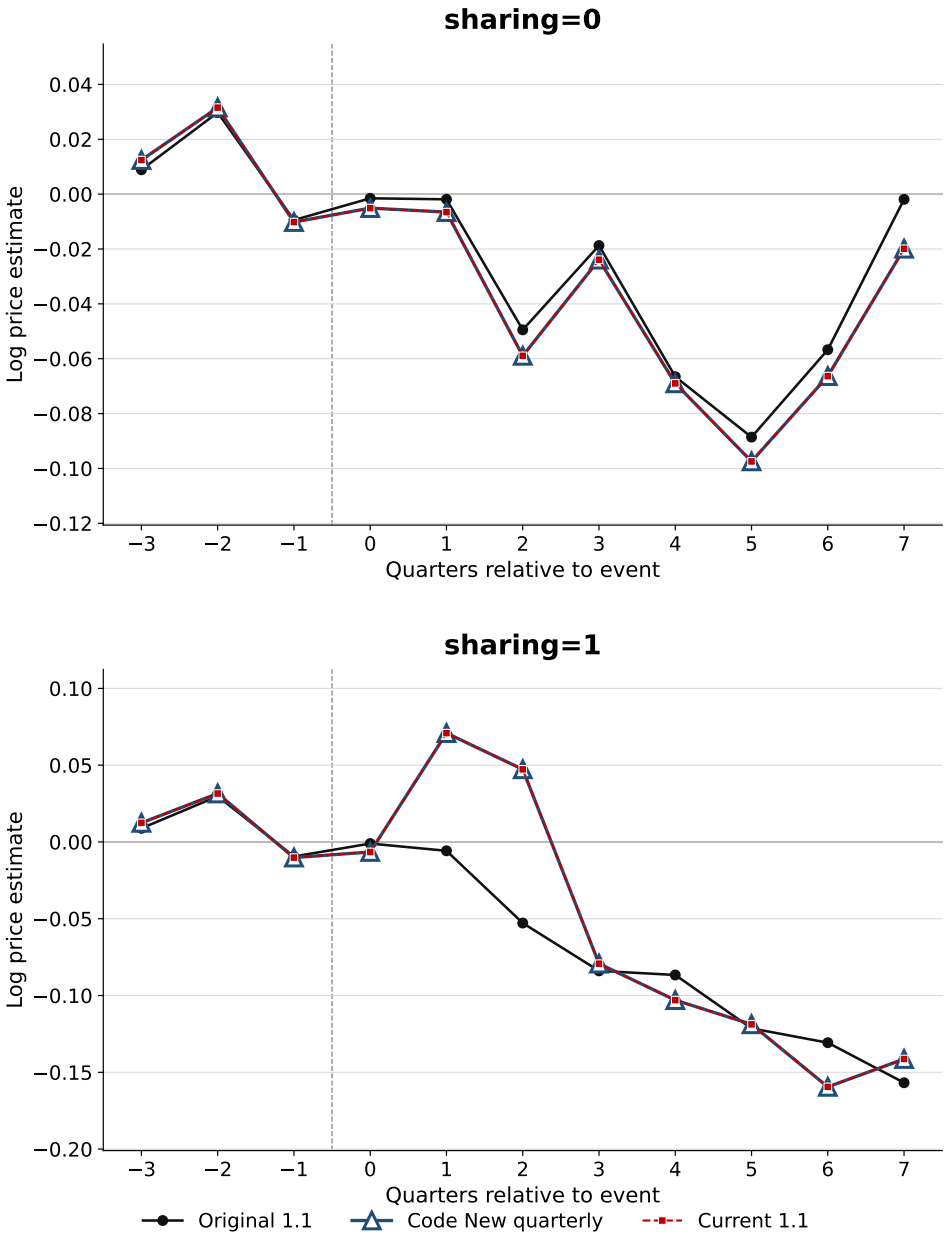

Figure 5: Event-study estimates for `to_B_not_in_A`, A side.

Notes. Black circles show the original 1.1 results from the earlier report, hollow blue triangles show Code New quarterly, and red squares show the current 1.1 run. The mean absolute gap from Code New over horizons 0–7 is 4.79e-08 for sharing 0 and 1.76e-07 for sharing 1.

`to_B_not_in_A`, B side

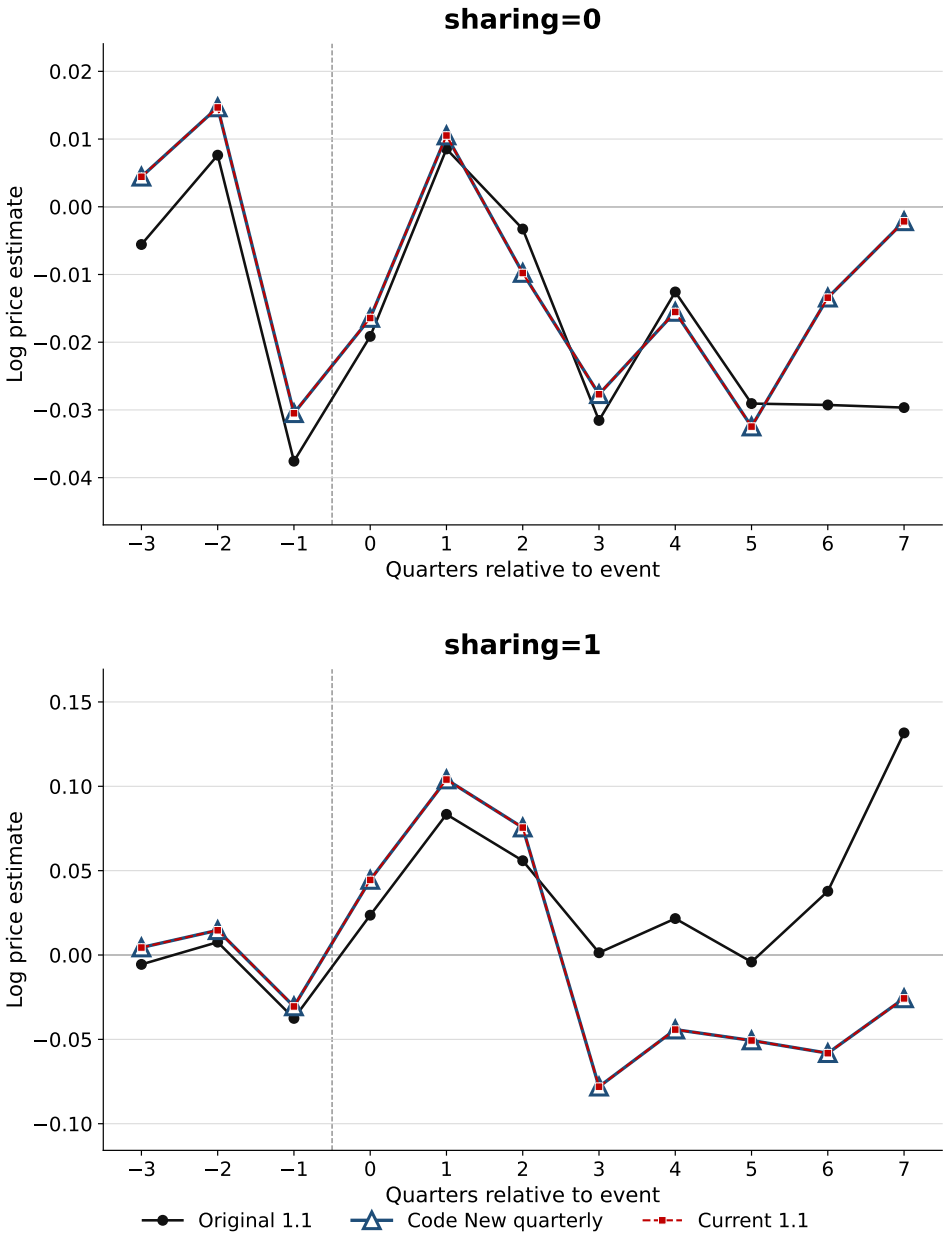

Figure 6: Event-study estimates for `to_B_not_in_A`, B side.

Notes. Black circles show the original 1.1 results from the earlier report, hollow blue triangles show Code New quarterly, and red squares show the current 1.1 run. The mean absolute gap from Code New over horizons 0–7 is 2.90e-08 for sharing 0 and 4.21e-08 for sharing 1.
